Question 1

Question text

Given an array A of sorted integers and another non negative integer k, find if there exists 2 indices i and j such that A[i] - A[j] = k, i = j.

Input Format

- 1. First line is number of test cases T. Following T lines conain:
- 2. N, followed by N integers of the array
- 3. The non-negative integer k

Output format

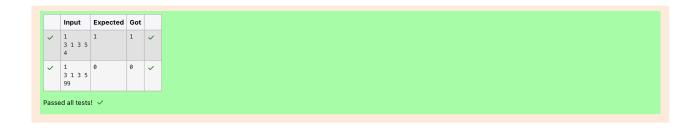

Print 1 if such a pair exists and 0 if it doesn't.

Example

Input:

```
3135
4
Output:
Input:
3135
99
Output:
Program:
#include <stdio.h>
int main() {
       int t;
       scanf("%d",&t);
       while(t-) {
              int n;
               scanf("%d",&n);
              int a[n];
              for (int I = 0; I < n; I++) {
                      scanf("%d",&a[I]);
              int k;
              scanf("%d",&k);
              int flag = 0;
              for (int I=0; I<n;I++) {
                      for (int j = I+1; j < n; j++) {
                             if (a[I] - a[j] == k | I | a[j] - a[I] == k) {
                                     flag = 1; break;
                             }
                      if (flag)
                      break;
              printf("%d\n",flag);
       }
       return 0;
}
```

Output:

Question 2

Question text

Sam loves chocolates and sarts buying them on the 1st day of the year. Each day of the year, x, is numbered from 1 to Y. On days when x is odd, Sam will buy x chocolates; on days when x is even, Sam will not purchase any chocolates. Complete the code in the editor so that for each day Ni (where $1 \le x \le N \le Y$) in array arr, the number of chocolates Sam purchased (during days 1 through N) is printed on a new line. This is a function-only challenge, so input is handled for you by the locked stub code in the editor.

Input Format

The program akes an array of integers as a parameter.

The locked code in the editor handles reading the following input from stdin, assembling it into an array of integers (arr), and calling calculate(arr). The first line of input conains an integer, T (the number of test cases). Each line i of the T subsequent lines describes the ith test case as an integer, Ni (the number of days).

Constraints

```
1 \le T \le 2 \times 105

1 \le N \le 2 \times 106

1 \le X \le N \le Y
```

Output Format

For each test case, Ti in arr, your calculate method should print the toal number of chocolates Sam purchased by day Ni on a new line.

Sample Input 0

Sample Output 0

1 1 4

Explanation

Test Case 0: N = 1

Sam buys 1 chocolate on day 1, giving us a toal of 1 chocolate. Thus, we print 1 on a new line.

Test Case 1: N = 2

Sam buys 1 chocolate on day 1 and 0 on day 2. This gives us a toal of 1 chocolate. Thus, we print 1 on a new line.

Test Case 2: N = 3

Sam buys 1 chocolate on day 1, 0 on day 2, and 3 on day 3. This gives us a toal of 4 chocolates. Thus, we print 4 on a new line.

Program:

```
\begin{tabular}{ll} \#include <stdio.h> \\ int main() \{ & int t; \\ scanf("%d",&t); \\ while(t-) \{ & int n,c = 0; \\ scanf("%d",&n); \\ for (int l = 0; l <=n; l++) \{ & if (l%2!=0) \\ c+=l; \\ \} & printf("%d\n",c); \\ \end{tabular}
```

```
return 0;
```

Output:

1 1	1	_
1	1	1
4	4	
1296		
2500 1849		
729	729	
400	400	
25 1521	25 1521	
25	25	
49	49	
2401	2401	
49 2401		49 2401

Question 3

Question text

The number of goals achieved by two fooball teams in matches in a league is given in the form of two lists. Consider:

- Fooball team A, has played three matches, and has scored { 1, 2, 3 } goals in each match respectively.
- Fooball team A, has played three matches, and has scored { 1, 2, 3 } goals in each match respectively.
- Fooball team B, has played two matches, and has scored { 2, 4 } goals in each match respectively.
- Fooball team B, has played two matches, and has scored { 2, 4 } goals in each match respectively.
- Your ask is to compute, for each match of team B, the toal number of matches of team A, where team A has scored less than or equal to the number of goals scored by team B in that match.
- · In the above case:
- · In the above case:
- For 2 goals scored by team B in its first match, team A has 2 matches with scores 1 and 2.
- For 2 goals scored by team B in its first match, team A has 2 matches with scores 1 and 2.
- For 4 goals scored by team B in its second match, team A has 3 matches with scores 1, 2 and 3.
- For 4 goals scored by team B in its second match, team A has 3 matches with scores 1, 2 and 3. Hence, the answer: {2, 3}.

Complete the code in the editor below. The program must return an array of m positive integers, one for each maxes[i] representing the toal number of elements nums[j] satisfying nums[j] \leq maxes[i] where $0 \leq$ j < n and $0 \leq$ i < m, in the given order.

It has the following:

nums[nums[0],...nums[n-1]]: first array of positive integers maxes[maxes[0],...maxes[n-1]]: second array of positive integers

Constraints

- $2 \le n, m \le 105$
- 1 \leq nums[j] \leq 109, where 0 \leq j < n.
- $1 \le \text{maxes}[i] \le 109$, where $0 \le i < m$.

Input Format For Custom Testing

Input from stdin will be processed as follows and passed to the function.

The first line conains an integer n, the number of elements in nums.

The next n lines each conain an integer describing nums[j] where $0 \le j < n$.

The next line conains an integer m, the number of elements in maxes.

The next m lines each conain an integer describing maxes[i] where $0 \le i < m$.

Sample Case 0 Sample Input 0

4 1

4

2

4

2

3

```
Sample Output 0
```

4

Explanation 0

```
We are given n = 4, nums = [1, 4, 2, 4], m = 2, and maxes = [3, 5].
1.For maxes[0] = 3, we have 2 elements in nums (nums[0] = 1 and nums[2] = 2) that are \leq maxes[0].
2.For maxes[1] = 5, we have 4 elements in nums (nums[0] = 1, nums[1] = 4, nums[2] = 2, and nums[3] = 4) that are \leq maxes[1].
```

Thus, the function returns the array [2, 4] as the answer.

Sample Case 1

```
Sample Input 1
5
2
10
5
4
8
4
3
1
7
```

Sample Output 1

8

Explanation 1

```
We are given, n = 5, nums = [2, 10, 5, 4, 8], m = 4, and maxes = [3, 1, 7, 8].
1. 2. 3. 4. For maxes[0] = 3, we have 1 element in nums (nums[0] = 2) that is \leq maxes[0].
For maxes[1] = 1, there are 0 elements in nums that are \leq maxes[1].
For maxes[2] = 7, we have 3 elements in nums (nums[0] = 2, nums[2] = 5, and nums[3] = 4) that are \leq maxes[3].
For maxes[3] = 8, we have 4 elements in nums (nums[0] = 2, nums[2] = 5, nums[3] = 4, and nums[4] = 8) that are \leq maxes[3].
```

Thus, the function returns the array [1, 0, 3, 4] as the answer.

Program:

```
#include <stdio.h>
int main() {
       int s1,s2,ans;
       scanf("%d",&s1);
       int a[s1];
       for(int i=0;i<s1;i++)
               scanf("%d",&a[i]);
       scanf("%d",&s2);
       int b[s2];
       for(int i=0;i<s2;i++)
       scanf("%d",&b[i]);
       for(int j=0; j<s2; j++) {
               for(int I=0;i<s1;i++) {
                      if(b[j]>=a[i])
                      ans++;
               printf("%d\n",ans);
       return 0;
}
```

Output:
